

# The Mobile ID Spot

Identifies & initiates tracking on the spot  
- *within seconds!*

The **Mobile ID Spot solution** reduces long waiting lines by identifying staff, volunteers, students, members, patients, etc. by issuing printed labels or wristbands quickly onsite and then enrolling that person within seconds by scanning their printed QR tag ID.

## How it Works

While people are standing in line, waiting to be enrolled into an event, users perform the following steps:

### 1. Identify

Scan a driver's license using a mobile scanner to collect data and generate a unique QR barcode.

### 2. Issue

Scan and assign a preset data tag if desired, such as *status, condition, allergy, etc.* Then print an ID wristband/label on the spot displaying the QR and collected data - all from the printer strapped to your hip.

Once they have reached the front of the line,

### 3. Track

Scan the QR tag into the Mobile ID software. Three things are performed instantaneously in that 1 second: data is populated into the Mobile ID software, that information is stored in the database, and an assignment may be created for that person.

## Greater Efficiency

Organizations of all types are now able to quicken their event check-in process using the **Mobile ID Spot** solution. With shorter lines, mobile data capture, and automated enrollment, *event check-in couldn't be any faster!*
